Semester 3| Batch 2025-29 | Session July-Dec 2026

INDEX

1	Introduction
2	Problem Statement
3	Objectives
4	Literature Review
5	Proposed Methodology
6	Results/Expected Outcome

INTRODUCTION

- The Student Feedback Management System is a web-based application built using Python ,Flask and MySQL to streamline the collection, processing, and analysis of student reviews and evaluations regarding faculty members , courses, and institutional facilities.

- Traditionally ,feedback collection relied heavily on paper forms or disjointed digital surveys which are time consuming to compile and analyze.

- This system modernizes the process by offering a centralized platform where students can submit constructive feedback securely and anonymously, enabling administration and faculty to gain actionable insights for continuous academic improvement

PROBLEM STATEMENT

Inefficiency of Traditional methods

Traditional paper-based feedback are inefficient and consume excessive time
Data Aggregation Challenges

Absence of Automated Reporting

The absence of automated reporting tools delays corrective action on academic or infrastructural grievances

Data Aggregation Challenges

Faculty and administrator struggle to aggregate ,filter,and extract meaningful trends from unstructured feedback data

Lack of anonymity

Existing digital forms lack anonymity ,leading to biased student responses due to privacy concerns

OBJECTIVES

- **DIGITIZE COLLECTION:-** Replace manual processes with a secure ,user-friendly digital portrait built on Python Flask for submitting academic and course feedback.

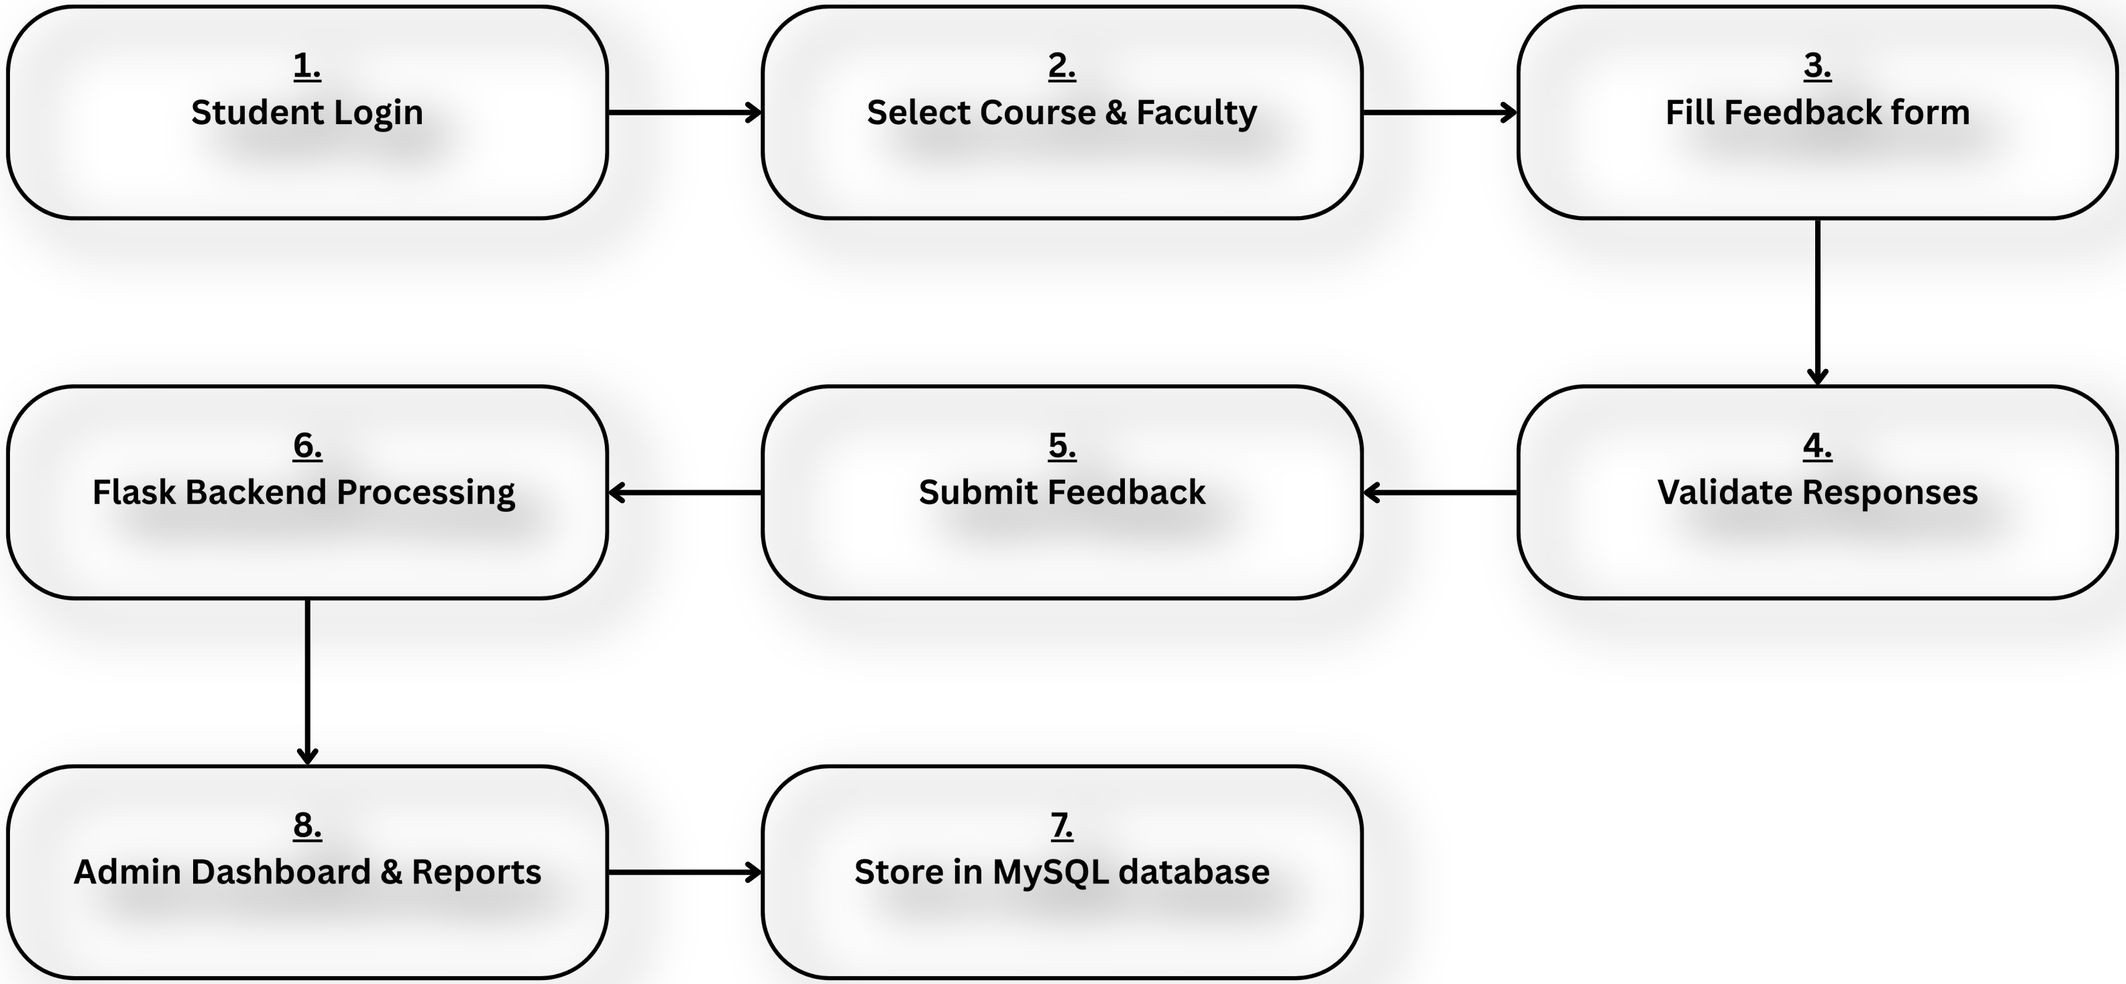

- **ENSURE ANONYMITY:-** Protect student identities through encrypted data handling and secure session management in the backend database .

- **DRIVE IMPROVEMENT:-** Help institutions identify areas requiring academic or infrastructural enhancement based on data-driven insights.

LITERATURE OVERVIEW

Study	Data	Key outcome	Limitation Gap
Traditional feedback system	Paper-based student responses	Collects feedback from students	Time-consuming Manual errors Difficult to analyze
Online feedback system	Digital forms and questionaries	Faster feedback collection and storage	Limited analysis and reporting
Web-based feedback management	Student feedback records	Centralized data management and easy access	Limited automation and personalization
Database-driven feedback system	MySQL database and student records	Secure storage , retrieval and organization of feedback	Depends on proper database maintenance
Automated feedback analysis	Ratings , comments, and survey responses	Helps identify satisfaction level and common issues	Subjective can be difficult to interpret

PROPOSED METHEDOLOGY - WORKFLOW

RESULTS {TILL NOW} / EXPECTED OUTCOME

Current Status	Expected Outcome
Project Idea and Objectives for the Student Feedback Management System have been defined.	A user-friendly web-based platform for students to submit feedback easily.
Technology stack selected : Python ,Flask , MySQL.	Secure storage and organized management of student feedback using MySQL.
Basic design and workflow for Student Feedback submission and storage have been planned.	Efficient feedback analysis to help faculty and administrators identify areas for improvement.
Core modules for feedback collection , database management and feedback viewing have been identified .	A scalable system that can support features such as reports ,analytics and feedback history.
